Implementation Plan

How Sali was built in stages, what each stage delivered, and what comes next.

IN ONE MINUTE

- Sali is live at sali.one. It was built in ten stages, each ending with something you can see and approve; eight are done.
- **Next:** the map view of the basket. Then later ideas, chosen by what users ask for.

8 of 10	29	2,000+	270
stages done	chains	stores	automated tests

01 The stages

Stage	What it delivered	Sign-off point
1 • Collect DONE	Downloading and reading the first chains' price files; exact decimals, batch loading.	One chain (about 1.5 million Shufersal rows) loaded
2 • Database and API DONE	The tables, Hebrew search that forgives spelling mistakes, product and basket comparison.	A basket total at each store is correct
3 • Website DONE	Search, product page, baskets, scan, filters, "near me": Hebrew, right to left, for phones.	Search, add and compare work at phone width

4 • Server and refresh DONE	A Worker refreshing the chains twice a day, a log of loaded files, read-only public side, backups, health checks, positions and pictures filled in the background.	426 Shufersal files in 243 s; a crash midway equals a clean load
5 • Quality and polish DONE	Fake-price filtering, input limits, security headers, About page, faster loading, error page, accessibility.	All tests pass; merged to main
6 • Going live DONE	One server in Israel behind sali.one with HTTPS; all 29 chains load; alerts and the off-server backup connected; every merged change is deployed automatically; search-engine page headers and a sitemap.	Data is fresh and the health check is healthy
7 • Promotions and Deals DONE	Promotions loaded for every chain; shown on the product page and applied in the basket (single products and groups); the Deals section with search and endless scrolling; duplicate, test and coupon promotions filtered out.	A dearer-on-the-shelf store can win a basket, and Deals shows no duplicates
8 • A fresh look DONE	A full redesign with the same features: photos, soft cards, banner, floating bar, animations, a first-visit tour.	Every page uses the new look
9 • Map view NEXT	See the basket's total at each nearby store on a map (steps below).	A Map toggle shows correct pins; navigation works
10 • Later LATER	Colour-contrast check and screen tests; fuller privacy text; more deal types; price alerts; sending a basket to a chain's site.	Chosen by what users ask for

02 Stage 9 in detail: the map view

1. **Two quick checks.** How many stores really have a position (about 86% did), and a trial cut of the Israel map to see its size and whether Hebrew labels look right.
2. **Choose the map source.** Recommended: host the map file on our own server, so there are no usage limits, no outside dependency and no change to the privacy text.
3. **Pins with totals,** cheapest highlighted, clusters when zoomed out, stores missing items in grey.
4. **List and map together:** moving the map updates the list; a pin opens the store with navigation. The map loads only when asked for.
5. **Test on phones** with 100 stores, with and without location permission.

03 What could go wrong

Risk	What we do
A chain changes its site and the download fails (often)	That chain fails alone; the library is pinned and upgraded on purpose; an alert fires after 5 silent days.
Promotion files make runs long or fill the disk	A run takes 2 to 3 hours and the disk has room; promotions can be limited to some chains or switched off with one setting.
Wrong prices or stale promotions in chain files	Fake prices are filtered; promotions count only when fresh and clearly safe; deals must beat the shelf price.
One server is a single point of failure	Accepted for now: nightly backups copied off the server, and recovery = restore + re-run the Worker.
Missing or approximate store positions (for the map)	An accuracy flag, and stores without a position are listed under the map.
